PROPERTY LOCATION

County: Bolivar Total Acres: 646 Latitude: -91 Longitude: 33.71

Section: 16 Township: 22N Range: 8W

DISCLAIMER

This information was derived from a small sampling of the forest resources. It reflects a statistical estimation that is only intended to be accurate enough for the purposes of making decisions for the short-term management of these resources. These estimations are temporally static. Events and circumstances may occur within the survey area that will physically alter the forest resources and therefore will not be reflected in this plan.

INTRODUCTION

This Forest Stewardship Management Plan will serve as a guide for accomplishing the goals and objectives for your property. In addition to addressing your specific goals and objectives, this plan includes recommendations for maintaining soil and water quality and protecting your forest from insects, disease, and wildfire. Recommendations are based on observation and assessment of the site.

OBJECTIVES

Timber Production

The goal is to produce high quality sawtimber. This will be accomplished through reforestation and timber stand improvement practices such as herbicide applications, prescribed burning, thinning at specified intervals, and other silvicultural practices. Forestry Best Management Practices will be implemented to prevent erosion and protect water quality.

Wildlife Management - General

The goal is to provide a diversity of habitats suitable for a variety of game and non-game wildlife species. Habitat management will focus on developing a variety of food, cover, water, and space. This will be accomplished by establishing and maintaining access roads and firelanes, providing openings within the forest, and the management of trees located within the Streamside Management Zone.

PROPERTY DESCRIPTION

General Property Information

This section is in the Southwest part of Bolivar County close to the Lobdell community. It is 5 miles North of Benoit, MS. Its bordered on the North by Neblett Road and Dossette Grove Road on the west side. Private forest land borders it on the east side with agricultural land to the south. A branch runs west to east through the North end called Christmas Lake Branch. This section contains a total of 180.26 forested acres and 466.09 acres of non forest land. The non forest land includes 18.17 acres of drains , 6.45 acres of roads, and 441.47 acre of open agricultural land.

Water Resources

Perennial water resources were identified during a reconnaissance of the property. Intermittent streams and drains identified will be managed in accordance with Mississippi's Best Management Practices. Christmas Lake branch runs west and east through the north end of the property but doesn't hold water year round and doesn't affect the forest land on the section.

Timber Production

The goal is to maximize the production of high quality timber. This will be accomplished through the application of timely thinning and other silvicultural practices designed to enhance timber quality and growth. Forestry Best Management Practices will be implemented to prevent erosion and protect water quality.

Threatened and Endangered Species

No threatened and endangered species were identified during the reconnaissance and evaluation of your property. If an endangered or threatened species should ever be found on the property, new management strategies will be impletmented to protect the species.

Interaction with Surrounding Property

Prescribed practices should be carried out in a manner that will minimize adverse impacts on surrounding properties. Consideration should be given to potential air, water, visual, and

other impacts. In addition, practices carried out should have positive effects on the surrounding community such as improved wildlife habitat and soil stabilization.

Soils General

Soils were evaluated on the property to determine the suitability of the site for the proposed activities. Forest practices were planned so as to minimize erosion or other adverse effects on the soil. The following soils are identified for this property: Sharkey Clay (Sb) and Dowling Clay (Dc).

Archeological or Cultural Resources

No archeological or cultural resources were found during a reconnaissance of the property. However, if any archeological or cultural resources are discovered at any time on the property, special management strategies will be applied immediately in order to preserve these sensitive areas. These areas can include old churches, cemetaries, indian mounds, old home sites, or other areas of historical significance.

GENERAL PROPERTY RECOMMENDATIONS

Forest Protection

A healthy and vigorously growing stand is the best defense to an attack from a variety of forest insects, plants and pathogens.

Insects and Diseases

Trees are subject to attack from insects and diseases. Different insects and diseases affect trees according to the age, species, and condition of the trees. Planted stands of pines and pure stands of hardwoods are particularly susceptible to attack. Since there are many different insects and diseases, no attempt will be made here to explain all of them. The property should be inspected at least annually for possible signs of insect and disease activity. Some things to look for are:

- Unseasonable leaf fall
- Discoloration of leaves or needles
- Pitch pockets on pine trees
- · Heavy defoliation of hardwood leaves
- Groups of three or more dying trees within a stand

This list does not cover all instances of insect or disease attacks. If anything unusual is noticed, report it to a forester. In most cases, insect and disease problems can be controlled if discovered early.

Fire Protection

Your forest should be protected from wildfire at all times. The best way to protect your investment is by establishing and maintaining firebreaks around the property. Guidelines for establishment and maintenance of firebreaks may be found in Mississippi Forestry Commission publication #107, *Mississippi's Best Management Practices*.

Grazing

Tree seedlings should be protected from grazing until such time as the terminal bud of the sapling is beyond reach of livestock. Domestic livestock should be denied access to the tree planting area.

Boundary Lines

It is the responsibility of the landowner to ensure that all property lines and boundaries designating areas to receive forestry work are clearly identified and visible to all contractors.

Note: Some forest practices may cause temporary adverse environmental or aesthetic impacts. These practices will only cause short-term adverse impacts where they are installed. Special efforts will be made to minimize adverse effects when carrying out any of the practices. Examples include: site preparation, planting, prescribed fires, firebreak installation and maintenance, road installation and maintenance, pesticide applications and timber harvesting.

Water Quality Protection

The objective of the landowner is to protect, preserve and enhance all water sources on or transecting the property. This can best be achieved by implementation of Best Management Practices in all aspects of the management of the property.

Aesthetics

The goal is to assure that the property is managed in such a way that is aesthetically pleasing to the landowner as well as the community. Activities could include, maintaining buffer strips along the road and adjacent to the home site, planting wildflowers along the road, and trees with attractive fall and spring color along the drive and near the home site.

Ecological Restoration

Ecological restoration is the process of assisting the recovery of an ecosystem that has be degraded, damaged, or destroyed. A reconnaissance of the property has been conducted and no ecological restoration activities are recommended at this time.

Wildlife Mgt. Target Species

The objective of this practice is to provide habitat best suited for the featured or target species. Habitat management will focus on providing food, cover, water, and space to facilitate the target species.

Environmental Education

Environmental educational goals are to provide educational opportunities for children and adults through the development of items such as nature trails with tree identification markers, wildlife viewing areas, picnic areas, parking, public restroom facilities.

Wildlife Management General

The goal is to provide a diversity of habitats suited for a variety of game and non-game wildlife species. Habitat management will focus on providing a variety of food, cover, water, and space. This will be accomplished, in part, by establishing and maintaining

access roads and firelanes, providing openings within the forest, and leaving mast producing and den trees.

Timber Management

Timber management goals for this property are to manage timber resources in such a manner as to maximize timber production throughout the life of the stand.

Recreation

According to landowner objectives the recreational use of the property could prove to be an avenue for personal enjoyment or for generating income. An evaluation of your property should be conducted and a plan developed to accomplish your specific goals for recreational activities on your property.

SOIL TYPES

Soil Description

Sharkey Clay, nearly level phase, is a dark colored, poorly drained soil formed from fine-textured Mississippi River Alluvium. It occurs on slack water flats. It is one of the most extensive soils in the county. It is medium acid to neutral and has slow permeability.

Dowling Clay with zero to one-half percent slope is a dark colored, poorly drained soil consisting of firm clay throughout. It occupies depressions or abandoned stream channels, generally found in association with other soils like Sharkey Clay. It tends to hold water longer than other soils.

STANDS

Stand Reproduction (S#1)

Stand Description

This is a 177.57 acre stand of 14 year old submerchantable timber. This stand was clearcut in the year 1997 and artificially regenerated the following year with oak seedlings at a rate of 200 per acre. It currently holds about 150 trees per acre. The dominant species in the stand are Sugarberry, Elm, Green Ash, and Oak.

Stand Recommendations

This stand should be allowed to grow for the next ten years. It will be monitored for insects and disease and fire by the Mississippi Forestry Commission.

Stand Reproduction (S#2)

Stand Description

This is a 2.69 acre stand of 14 year old submerchantable timber. This stand was clearcut in the year 1997 and artificially regenerated the following year with oak seedlings at a

rate of 200 per acre. It currently holds about 150 trees per acre. The dominant species in the stand are Sugarberry, Elm, Green Ash, and Oak.

Stand Recommendations

This stand should be allowed to grow for the next 10 years. It will be monitored for insects, disease, and fire by the Mississippi Forestry Commission.
